Modeling Implementations with UML

9

A Word on UML

UML is a standard, established notation

Most software engineers can read it, many tools support it

Few practitioners use it rigorously

Commonly used *informally* for sketching, communication, documentation, wall art

In this course: Use UML for communication; follow notation somewhat rigorously, but won't care about all details

From concepts to objects

- How are domain concepts different from classes?
  - Should every concept become a class?
 - Does every class need to represent a concept?

```

# Object Diagram Notation: Classes/Objects

Classname
(lowercase
name of
objects)

Fields

Methods

LibraryAccount
id: int lateFees: int
borrow(Book): bool returnItem(Book) payFees(int)

```java
class LibraryAccount {
    id: int;
    lateFees: int;
    boolean borrow(Book b) {…}
    void returnItem(Book b) {…}
    void payFees(int payment) {…}
}
```

institute for
SOFTWARE
RESEARCH

Object Diagram Notation: Interfaces

Interface name ⟶

Methods ⟶

| *LibraryAccount* |
|---|
| borrow(Book): bool <br> returnItem(Book)
 payFees(int) |

```
interface LibraryAccount {
    boolean borrow(Book b);
    void returnItem(Book b);
    void payFees(int payment);
}
```

institute for SOFTWARE RESEARCH

Object Diagram Notation: Associations

LibraryAccount
id: int lateFees: int
borrow(Book)

borrowed

1   *

| Book |
| --- |
| author: String |
| |

```
class LibraryAccount {

    ...

    List<Book> borrowedBooks;

}

class Book {

    ...

    LibraryAccount borrowedBy;

}
```

Object Diagram Notation: Associations

LibraryAccount
id: int lateFees: int
borrow(Book)

borrowed

Book
author: String

1   *

```
class LibraryAccount {

    ...

    List<Book> borrowedBooks;

}
class Book {

    ...

}
```

institute for
SOFTWARE
RESEARCH

Object Diagram Notation: Associations

LibraryAccount
id: int lateFees: int borrowed: List\<Book\>
borrow(Book)

| Book |
| --- |
| author: String
borrowedBy: LibraryAccount |
| |
Don't use fields instead or in addition to associations. Use fields only for basic types

Class Diagram vs Object Diagram

Can model both classes and objects

Terms often used interchangeably

If specific objects should be modeled use "objectId: Class" notation

a: LibAccount
id: int   lateFees: int
borrow(Book)

account:
id: int   lateFees: int
borrow(Book)

| : LibAccount |
|---|
| id: int <br> lateFees: int |
| borrow(Book) |
Class Diagrams and JavaScript/TypeScript

Even when not using classes, use the notation for representing the same idea: many objects sharing a shape

TypeScript interfaces match to class diagram notation

LibraryAccount
id: int lateFees: int
borrow(Book): bool returnItem(Book) payFees(int)
```
function newLibraryAccount(id, lateFees) {

    return {

        borrow: function(book) {…},

        returnItem: function(book) {…},

        payFees: function(payment) {…}

    }

}
```

One object model for the library system

institute for
SOFTWARE
RESEARCH
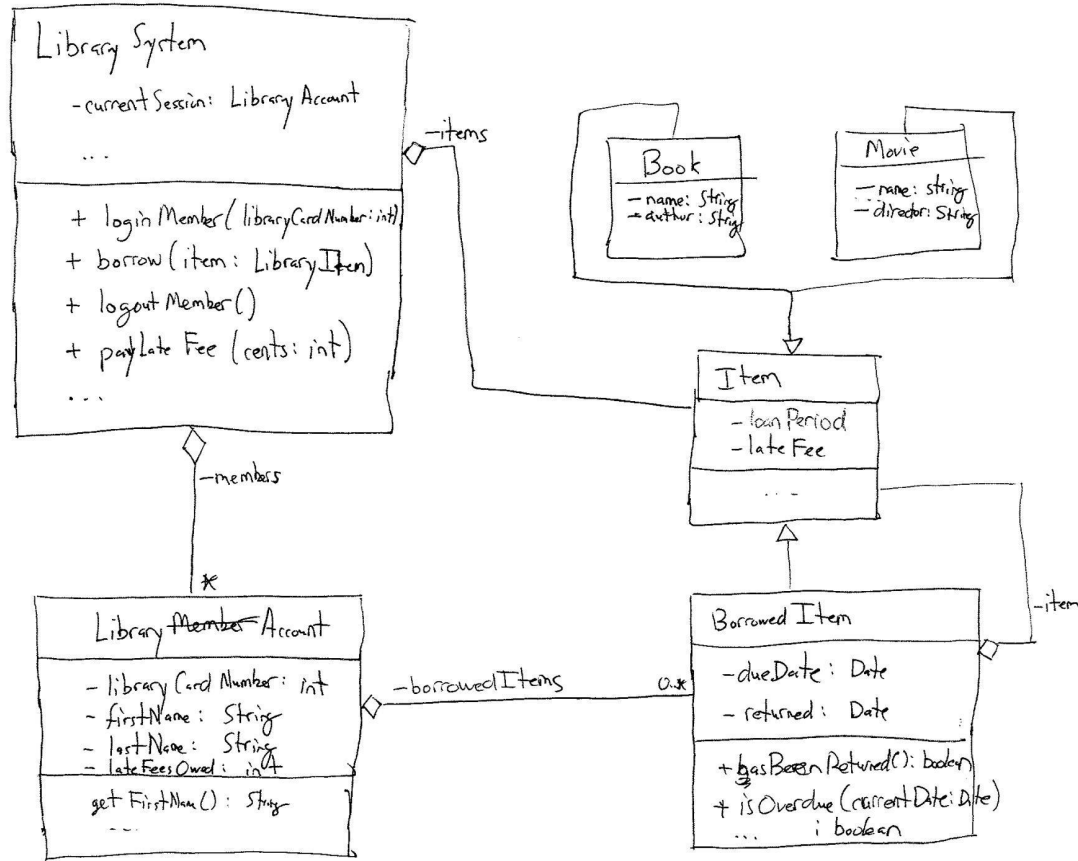

Domain model (left) vs object model (right)

institute for
SOFTWARE
RESEARCH
Object diagram notation requirements

We won't be very picky on notation, but:

- Use boxes with 2 or 3 parts for fields, methods as appropriate for classes/objects, interfaces, concepts
- Include types for fields and methods
- Use associations, not fields, where appropriate
- Use association names and cardinalities (we don't care about arrow types, except "is-a")

Modeling interactions past the system boundary

Use case scenario: A library member should be able to <u>use her library card to log in</u> at a library system kiosk and <u>borrow a book</u>. After confirming that the member has no unpaid late fees, the library system should determine the book's <u>due date</u> by adding its rental period to the current day, and record the book and its due date as a borrowed item in the member's library account.

Use case:
login &
borrow a book.

: Library System

loginMember(library Card)
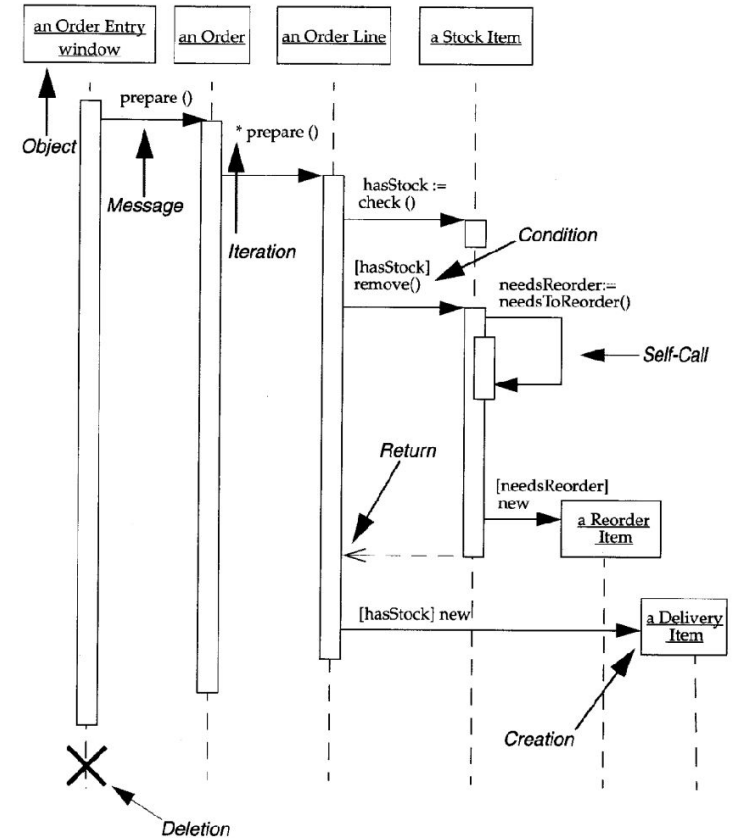

borrow(book item)

success?, dueDate
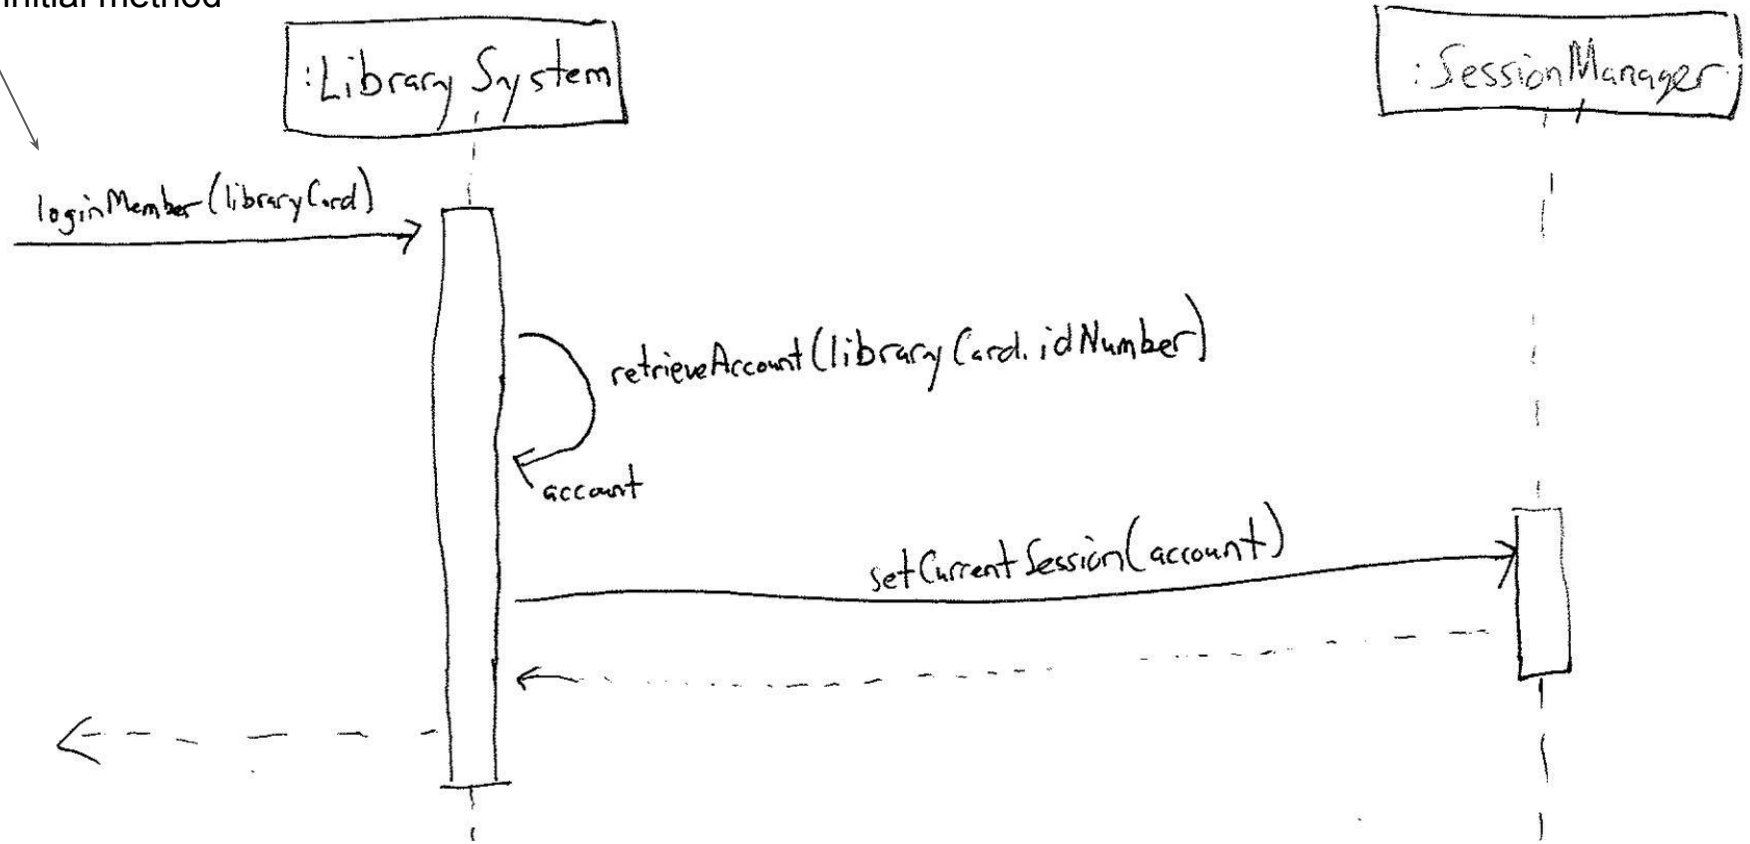

Interaction Diagrams

Interactions between objects

Two common notations: sequence diagrams and communication diagrams

Sequence diagrams like system sequence diagrams, but depicting interactions between objects/classes
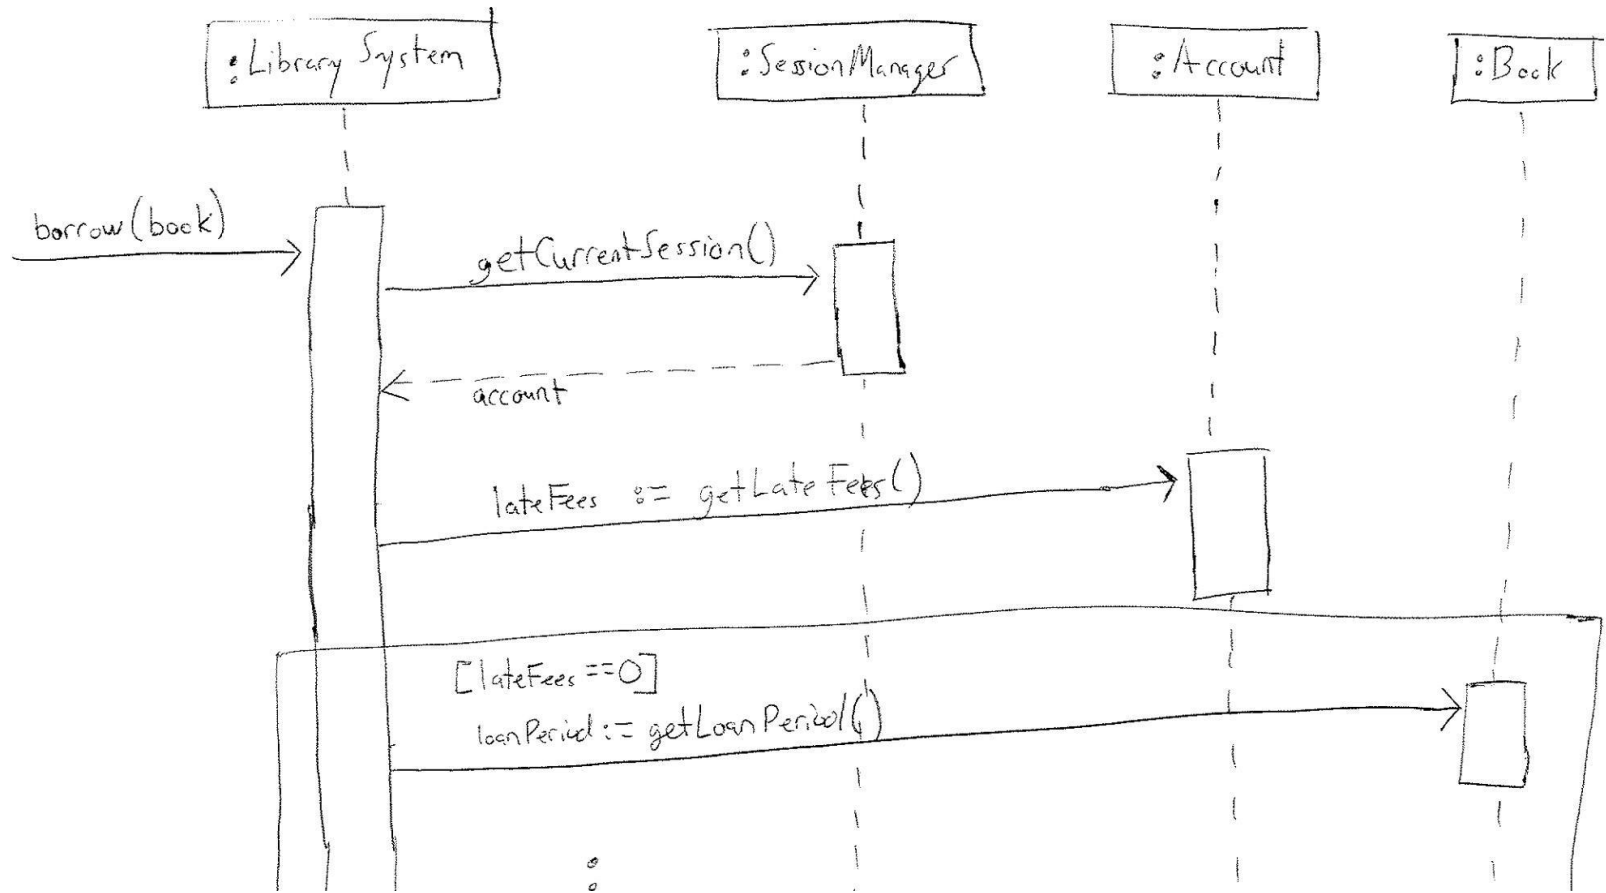

always start with
an initial method

:Library System

:SessionManager

loginMember (libraryCard)

retrieveAccount (libraryCard. idNumber)

account

setCurrentSession (account)

Interaction Diagram Practice:

<u>Use case scenario</u>: …and borrow a book. After confirming that the member has no unpaid late fees, the library system should determine the book's due date by adding its loan period to the current day, and record the book and its due date as a borrowed item in the member's library account.

borrow(book)

:Library System

:SessionManager

:Account

:Book

getCurrentSession()

account

lateFees := getLateFees()

[lateFees == 0]

loanPeriod := getLoanPeriod()

# Interaction diagrams help evaluate design alternatives

- Explicitly consider design alternatives
- For each, sketch the interactions implied by the design choice
  - Interactions correspond to the components' APIs

Sys seq diag. (left) vs interaction diag. (right)

Considering the Library problem, which class should **know** which items have been borrowed by a user?
Which should **compute** late fees?
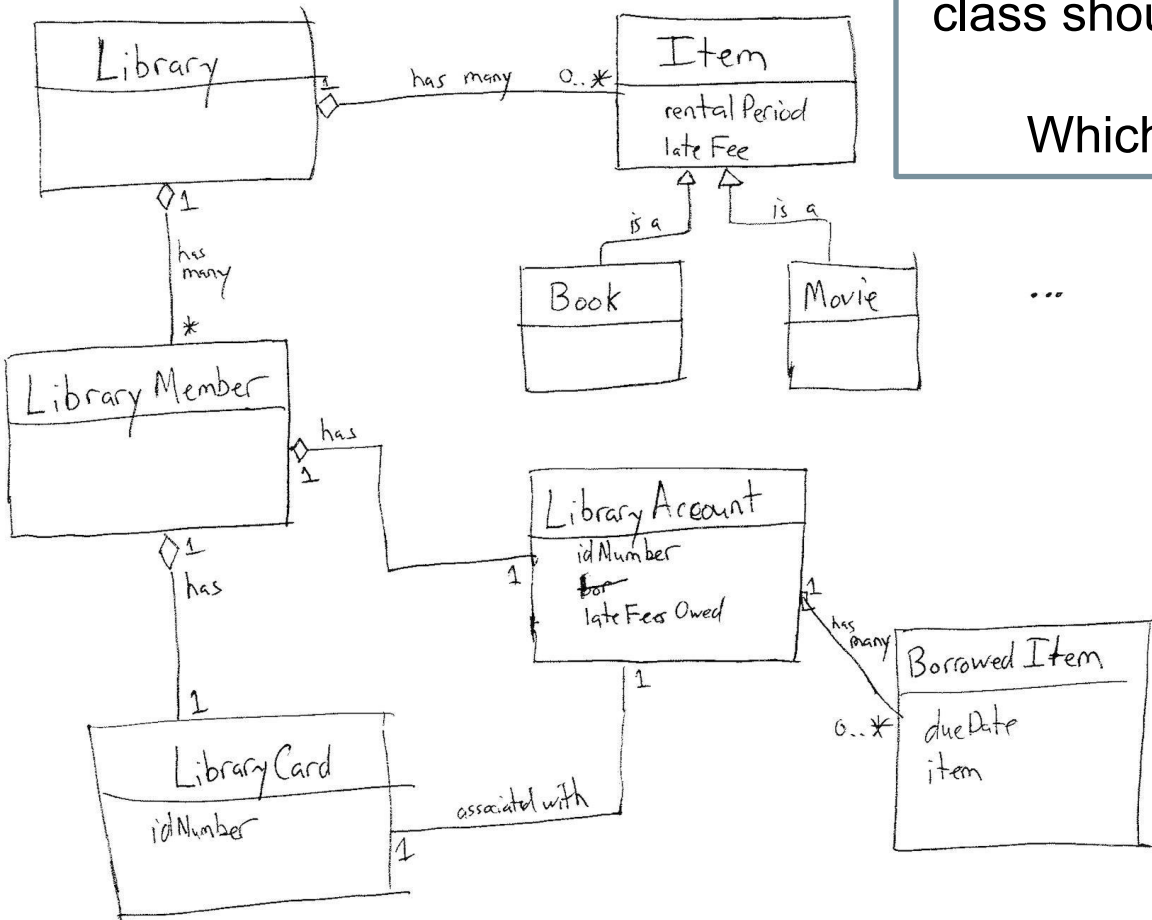

Doing and Knowing *Responsibilities*

Responsibilities are related to the obligations of an object in terms of its behavior.

Doing responsibilities of an object include:

- doing something itself, such as creating an object or doing a calculation
- initiating action in other objects
- controlling and coordinating activities in other objects

Knowing responsibilities of an object include:

- knowing about private encapsulated data
- knowing about related objects
- knowing about things it can derive or calculate

Design Principle:
Low Representational Gap

Low Representational Gap

Identified concepts provide inspiration for classes in the implementation

Classes mirroring domain concepts often intuitive to understand, rarely change (low representational gap)

```
class Account {
    id: Int;
    lateFees: Int;
    borrowed: List<Book>;
    boolean borrow(Book) { … }
    void save();
}
class Book { … }
```

Low Representational Gap

Identified concepts provide inspiration for classes in the implementation

Classes mirroring domain concepts often intuitive to understand, rarely change (low representational gap)
```
class LibraryDatabase {
    Map<Int, List<Int>>
        borrowedBookIds;
    Map<Int, Int> lateFees;
    Map<Int, String>
        bookTitles;
}
class DatabaseRow { … }
```

Library Account
accountID lateFees

Book
title author

borrow

1   *
institute for
SOFTWARE
RESEARCH

Designs with Low Representational Gap

- Create software class for each domain class, create corresponding relationships
- Design goal: Design for change
- This is only a starting point!
  - Not all domain classes need software correspondence
  - Pure fabrications might be needed
  - Other principles often more important

```

DESIGN PRINCIPLE: LOW COUPLING

Design Principle: Low Coupling

A module should depend on as few other modules as possible

- Enhances understandability (*design for understanding*)

  - Limited understanding of context, easier to understand in isolation

- Reduces the cost of change (*design for change*)

  - Little context necessary to make changes

  - When a module interface changes, few modules are affected (reduced rippling effects)

- Enhances reuse (*design for reuse*)

  - Fewer dependencies, easier to adapt to a new context

# Topologies with different coupling

Types of module interconnection structures
(A) (B) (C)

High Coupling is undesirable

- Element with low coupling depends on few other elements
  - Elements == classes, subsystems, …
  - "few" is context-dependent
- A class with high coupling relies on many other classes
  - Changes in related classes force local changes; changes in local class forces changes in related classes (brittle, rippling effects)
  - Harder to understand in isolation.
  - Harder to reuse because requires additional presence of other dependent classes
  - Difficult to extend – changes in many places

```java
class Shipment {
    private List<Box> boxes;
    int getWeight() {
        int w=0;
        for (Box box: boxes)
            for (Item item: box.getItems())
                w += item.weight;
        return w;
    }
}
class Box {
    private List<Item> items;
    Iterable<Item> getItems() { return items;}
}
class Item {
    Box containedIn;
    int weight;
}
```

RESEARCH

Design Heuristic: Law of Demeter

- *Each module should have only limited knowledge about other units: only units "closely" related to the current unit*

- In particular: Don't talk to strangers!

- For instance, no a.getB().getC().foo()

```
for (let i of shipment.getBox().getItems())
    shipmentWeight += i.getWeight() …
```

So don't do this^ !!

institute for
SOFTWARE
RESEARCH

Coupling: Discussion

- High coupling to very stable elements is usually not problematic
  - A stable interface is unlikely to change, and likely well-understood
  - *Prefer coupling to interfaces over coupling to implementations*
- (Details next time:) Subclass/superclass coupling is particularly strong
  - Protected fields and methods are visible
  - Subclass is fragile to many superclass changes, e.g. change in method signatures, added abstract methods
  - *Guideline: prefer composition to inheritance, to reduce coupling*
- Coupling is one principle among many
  - Consider cohesion, low repr. gap, and other principles

Design Goals

- Explain how low coupling supports

    ○ design for change

    ○ design for understandability

    ○ design for division of labor

    ○ design for reuse

    ○ …

Design Goals

- Design for change
  - Changes easier because fewer dependencies on fewer other objects
  - Changes are less likely to have rippling effects
- Design for understandability
  - Fewer dependencies to understand (e.g., a.getB().getC().foo())
- Design for division of labor
  - Smaller interfaces, easier to divide
- Design for reuse
  - Easier to reuse without complicated dependencies

Design Heuristic: CONTROLLER
(also DESIGN PATTERN: FAÇADE)

Controller (Design Heuristic)

- Problem: What object receives and coordinates a system operation (event)?

- Solution: Assign the responsibility to an object representing

  - The overall system, device, or subsystem (façade controller), or

  - A use case scenario within which the system event occurs (use case controller)

- Process: Derive from system sequence diagram (key principles: Low representational gap and high cohesion)
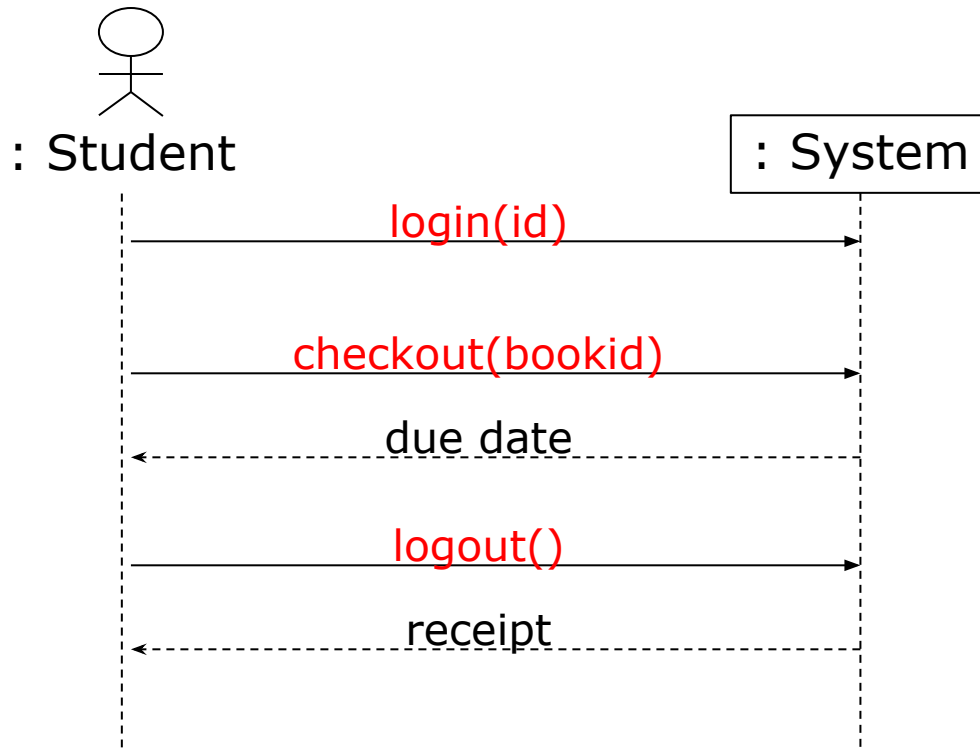

Requirements Analysis

Object-Level Design

Requirements Analysis (left diagram):

Student → : System

- login(id)
- checkout(bookid)
- due date
- logout()
- receipt

Object-Level Design (right diagrams):

1: login(uid) → : CheckoutController
- 2: check(uid) → : UserDB
- 3: setUser(uid) → : Session

1: checkout(bid) → : CheckoutController
- 3: b=findBook() → : BookDB
- 2: uid=getUser() → : Session
- 4: setBorrowedBy(uid) → b: Book

institute for SOFTWARE RESEARCH
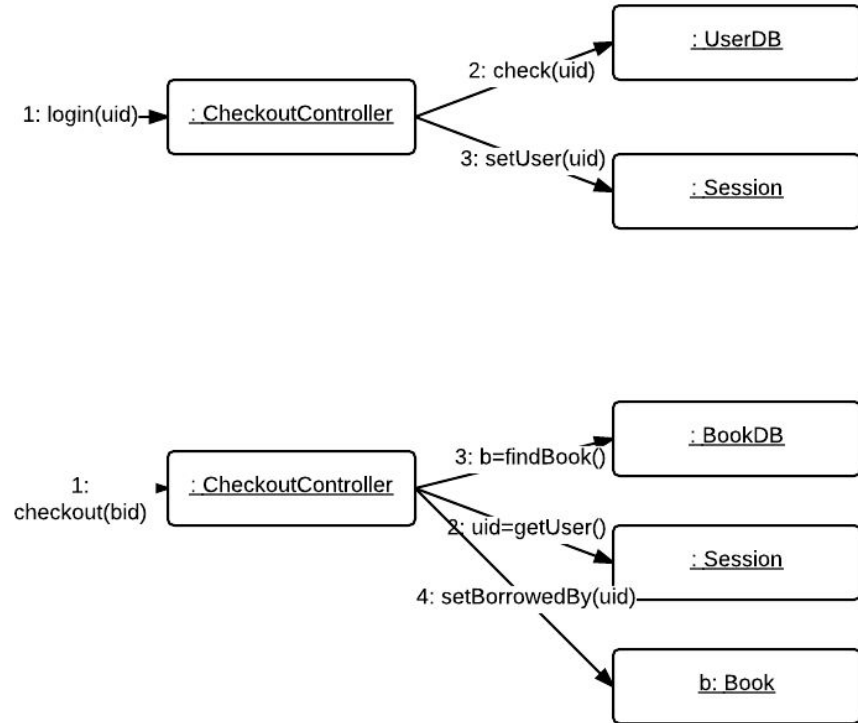

Controller: Discussion

- A Controller is a coordinator
  - does not do much work itself
  - delegates to other objects
- Façade controllers suitable when not "too many" system events
  - -> one overall controller for the system
- Use case controller suitable when façade controller "bloated" with excessive responsibilities (low cohesion, high coupling)
  - -> several smaller controllers for specific tasks

- Closely related to Façade design pattern (future lecture)

institute for
SOFTWARE
RESEARCH

Controller: Design Tradeoffs

Decreases coupling

- User interface and domain logic are decoupled from each other
  - Understandability: can understand these in isolation, leading to:
  - Evolvability: both the UI and domain logic are easier to change
- Both are coupled to the controller, which serves as a mediator, but this coupling is less harmful
  - The controller is a smaller and more stable interface
  - Changes to the domain logic affect the controller, not the UI
  - The UI can be changed without knowing the domain logic design

Supports reuse

- Controller serves as an interface to the domain logic
- Smaller, explicit interfaces support evolvability

But, bloated controllers increase coupling and decrease cohesion; split if applicable

Controller in Flash Cards Project?

DESIGN PRINCIPLE: HIGH COHESION
(OR SINGLE RESPONSIBILITY PRINCIPLE)

Design Principle: Cohesion

A module should have a small set of related responsibilities

- Enhances understandability (design for understandability)

  - A small set of responsibilities is easier to understand

- Enhances reuse (design for reuse)

  - A cohesive set of responsibilities is more likely to recur in another application

institute for
SOFTWARE
RESEARCH
```
class DatabaseApplication
    public void authorizeOrder(Data data, User currentUser, ...){
        // check authorization
        // lock objects for synchronization
        // validate buffer
        // log start of operation
        // perform operation
        // log end of operation
        // release lock on objects
    }
    public void startShipping(OtherData data, User currentUser, ...){
        // check authorization
        // lock objects for synchronization
        // validate buffer
        // log start of operation
        // perform operation
        // log end of operation
        // release lock on objects
    }
}
```

Anti-Pattern: God Object

```java
class Chat {
    List<String> channels;
    Map<String, List<Msg>> messages;
    Map<String, String> accounts;
    Set<String> bannedUsers;
    File logFile;
    File bannedWords;
    URL serverAddress;
    Map<String, Int> globalSettings;
    Map<String, Int> userSettings;
    Map<String, Graphic> smileys;
    CryptStrategy encryption;
    Widget sendButton, messageList;
}
```

Anti-Pattern: God Object

```java
class Chat {
    List<String> channels;

    Map<String, List<Msg>> messages;

    Map<String, String> accounts;

    Set<String> bannedUsers;

    File logFile;

    File bannedWords;

    URL serverAddress;

    Map<String, Int> globalSettings;

    Map<String, Int> userSettings;

    Map<String, Graphic> smileys;

    CryptStrategy encryption;

    Widget sendButton, messageList;
```

```java
class Chat {
    Content content;
    AccountMgr accounts;
    File logFile;
    ConnectionMgr conns;
}
class ChatUI {
    Chat chat;
    Widget sendButton, …;
}
class AccountMgr {
    … acounts, bannedUsr…
}
```

Cohesion in Graph Implementations

```java
class Graph {
    Node[] nodes;
    boolean[] isVisited;
}
class Algorithm {
    int shortestPath(Graph g, Node n, Node m) {
        for (int i; …)
            if (!g.isVisited[i]) {

                …
                g.isVisited[i] = true;
            }
        }
        return v;
    }
}
```

Is this a good implementation?

Cohesion in Graph Implementations

```java
class Graph {
    Node[] nodes;
    boolean[] isVisited;
}
class Algorithm {
    int shortestPath(Graph g, Node n, Node m) {
        for (int i; …)
            if (!g.isVisited[i]) {

                …
                g.isVisited[i] = true;
            }
        }
        return v;
    }
}
```
Graph is tasked with not just data, but also algorithmic responsibilities

Monopoly Example

```java
class Player {
    Board board;
    /* in code somewhere… */ this.getSquare(n);
    Square getSquare(String name) { // named monopoly squares
        for (Square s: board.getSquares())
            if (s.getName().equals(name))
                return s;
        return null;
}}
```

```java
class Player {
    Board board;
    /* in code somewhere… */ board.getSquare(n);
}
class Board{
    List<Square> squares;
    Square getSquare(String name) {
        for (Square s: squares)
            if (s.getName().equals(name))
                return s;
        return null;
}}
```

Hints for Identifying Cohesion

- Use one color per concept

- Highlight all code of that concept with the color

- => Classes/methods
  should have few colors

Hints for Identifying Cohesion

● There is no clear definition of what a "concept" is

● Concepts can be split into smaller concepts

   ○ Graph with search vs. Basic Graph + Search Algorithm vs. Basic Graph
      + Search Framework + Concrete Search Algorithm etc

● Requires engineering judgment

Cohesion: Discussion

Very Low Cohesion: A Class is solely responsible for many things in very different functional areas

Low Cohesion: A class has sole responsibility for a complex task in one functional area

High Cohesion: A class has moderate responsibilities in one functional area and collaborates with classes to fulfil tasks

Advantages of high cohesion

- Classes are easier to maintain
- Easier to understand
- Often support low coupling
- Supports reuse because of fine grained responsibility

Rule of thumb: a class with high cohesion has relatively few methods of highly related functionality; does not do too much work

Coupling vs Cohesion (Extreme cases)

All code in one class/method

- very low coupling, but very low cohesion

Every statement separated

- very high cohesion, but very high coupling

Find good tradeoff; consider also other principles, e.g., low representational gap

institute for
SOFTWARE
RESEARCH

Cohesion in Flash Cards Project?

Design Heuristic:
INFORMATION EXPERT

Information Expert (Design Heuristic)

- Heuristic: **Assign a responsibility to the class that has the information necessary to fulfill the responsibility**

- Typically follows common intuition

- Software classes instead of Domain Model classes

  - If software classes do not yet exist, look in Domain Model for fitting abstractions (-> correspondence)

- Design process: Derive from domain model (key principles: Low representational gap and low coupling)

Which class has all the information to compute the shipment's weight?

```java
class Shipment {
    private List<Box> boxes;
    int getWeight() {
        int w=0;
        for (Box box: boxes)
            for (Item item: box.getItems())
                w += item.weight;
        return w;
    }
}
class Box {
    private List<Item> items;
    Iterable<Item> getItems() { return items;}
}
class Item {
    Box containedIn;
    int weight;
}
```

Information Expert → "Do It Myself Strategy"

- Expert usually leads to designs where a software object does those operations that are normally done to the inanimate real-world thing it represents
  - A sale does not tell you its total; it is an inanimate thing
- In OO design, all software objects are "alive" or "animated," and they can take on responsibilities and do things.
- They do things related to the information they know.

institute for
SOFTWARE
RESEARCH

Information Experts in FlashCards$^{TM©®}$?

Who knows the text on a card?

Who checks correctness of an answer?

Who processes command-line options?

Who stores past answers?

Who knows how to flip cards?

Who tracks which achievements have been achieved?

Design Heuristic: CREATOR

institute for
SOFTWARE
RESEARCH

Creator (Design Heuristic)

Problem: Who creates an A?

Solution: Assign class responsibility of creating instance of class A to B if

- B aggregates A objects, B contains A objects, B records instances of A objects, B closely uses A objects, B has the initializing data for creating A objects (the more the better)

- Where there is a choice, prefer B aggregates or contains A objects

**Key idea:** Creator needs to keep reference anyway and will frequently use the created object

Process: Extract from domain model, interaction diagrams (key principles: Low coupling and low representational gap)

Creator heuristic

- Design process: Extract from domain model, interaction diagrams
  - Key principles: Low coupling and low representational gap
Creator (GRASP)

- Who is responsible for **creating** Beetle objects? Tree objects?
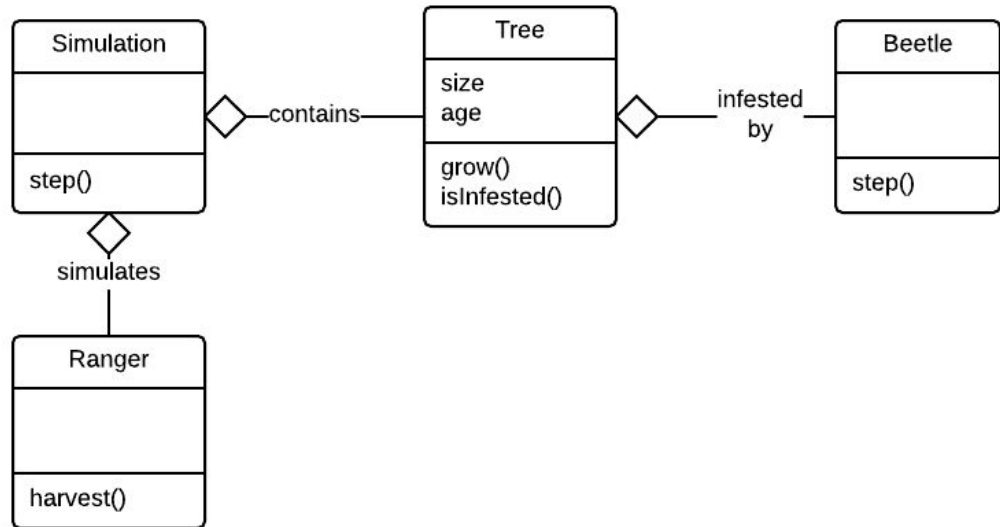

Creator: Example

- Who is responsible for creating Beetle objects?
  - Creator pattern suggests Tree
- Interaction diagram:

Creator (GRASP)

- Problem: Assigning responsibilities for creating objects

  ○ Who creates Nodes in a Graph?

  ○ Who creates instances of SalesItem?

  ○ Who creates Children in a simulation?

  ○ Who creates Tiles in a Monopoly game?

    ■ AI? Player? Main class? Board? Meeple (Dog)?

Creator: Discussion of Design Goals/Principles

Promotes **low coupling**, **high cohesion**

- Class responsible for creating objects it needs to reference
- Creating the objects themselves avoids depending on another class to create the object

Promotes **evolvability** (design for change)

- Object creation is hidden, can be replaced locally

Contra: sometimes objects must be created in special ways

- Complex initialization
- Instantiate different classes in different circumstances
- *Then **cohesion** suggests putting creation in a different object*: see *design patterns* such as builder, factory method
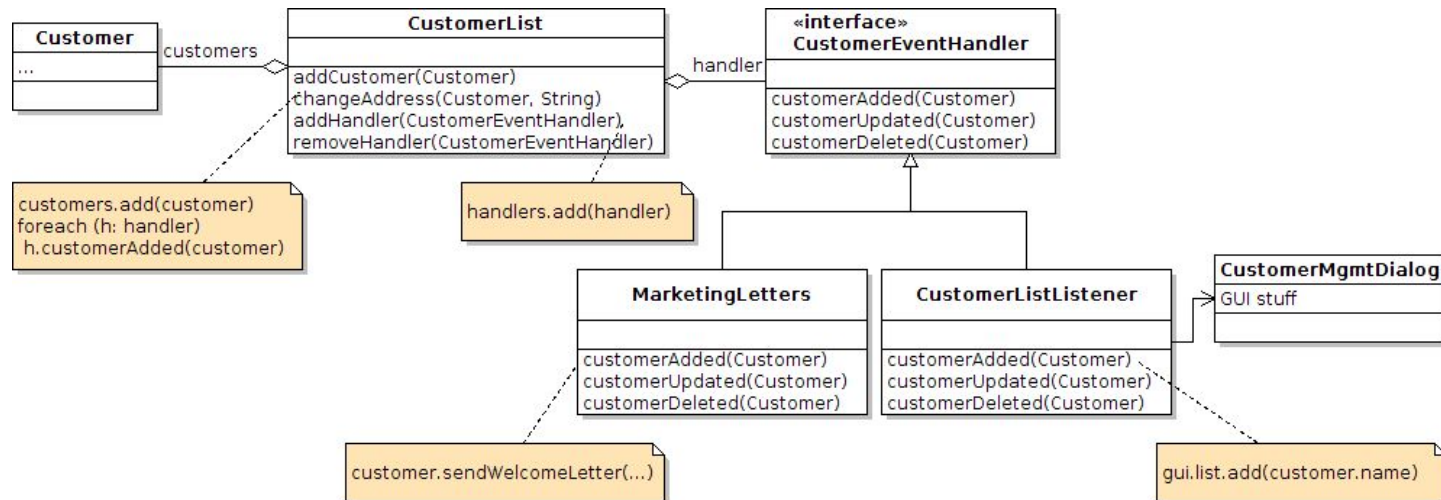

Creator in Flash Cards Project

Who creates cards?

Who creates a card deck?

Who creates achievements?

Which design is better? Argue with design goals, principles, heuristics, and patterns that you know

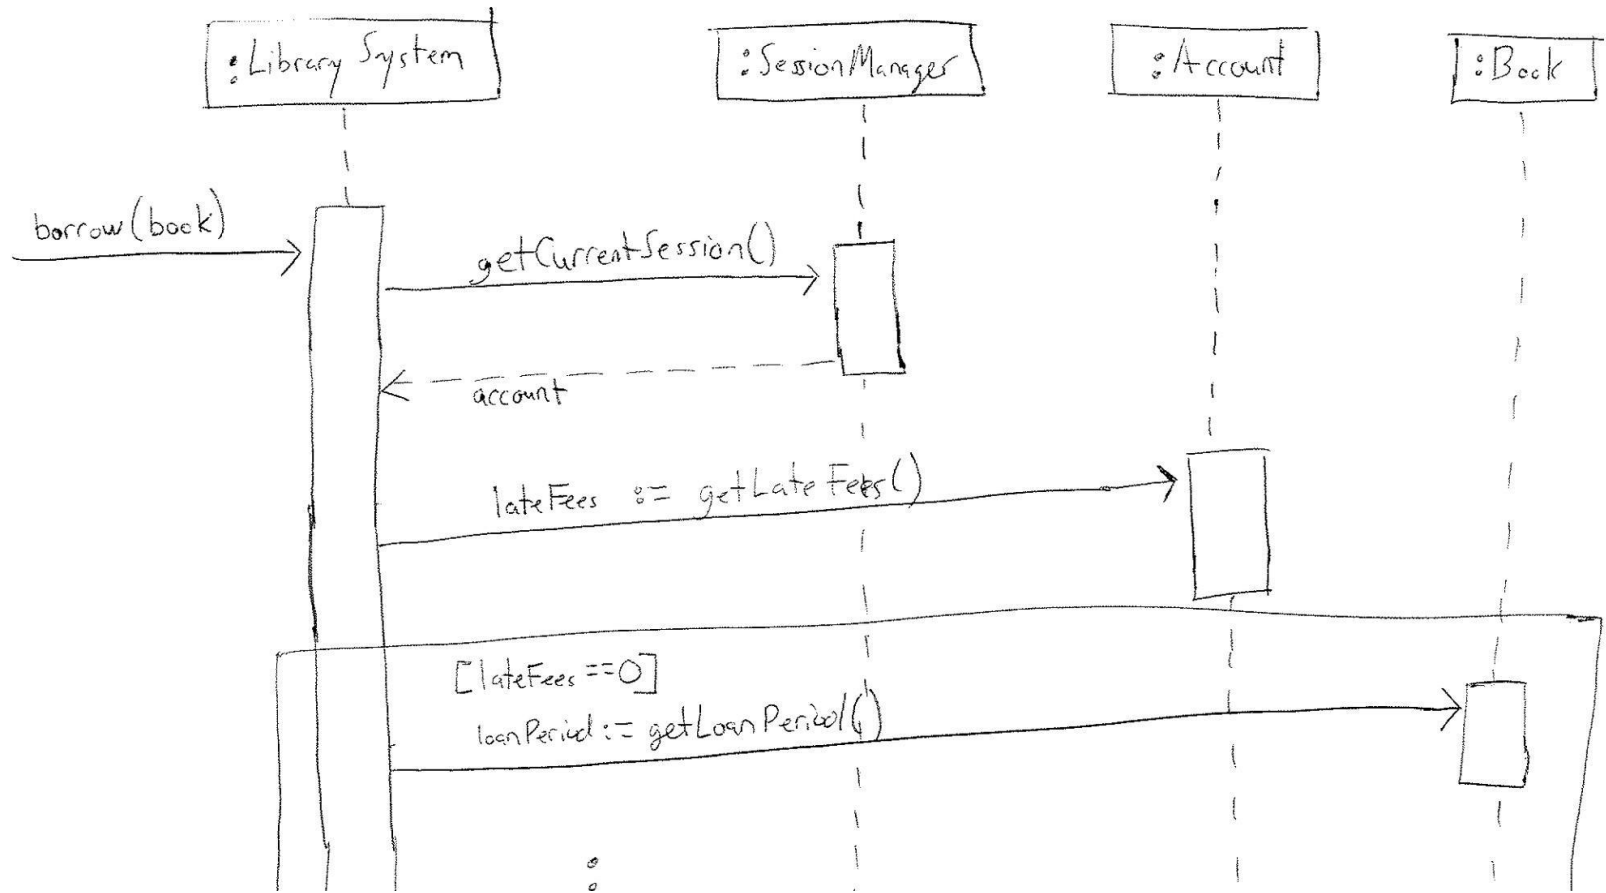

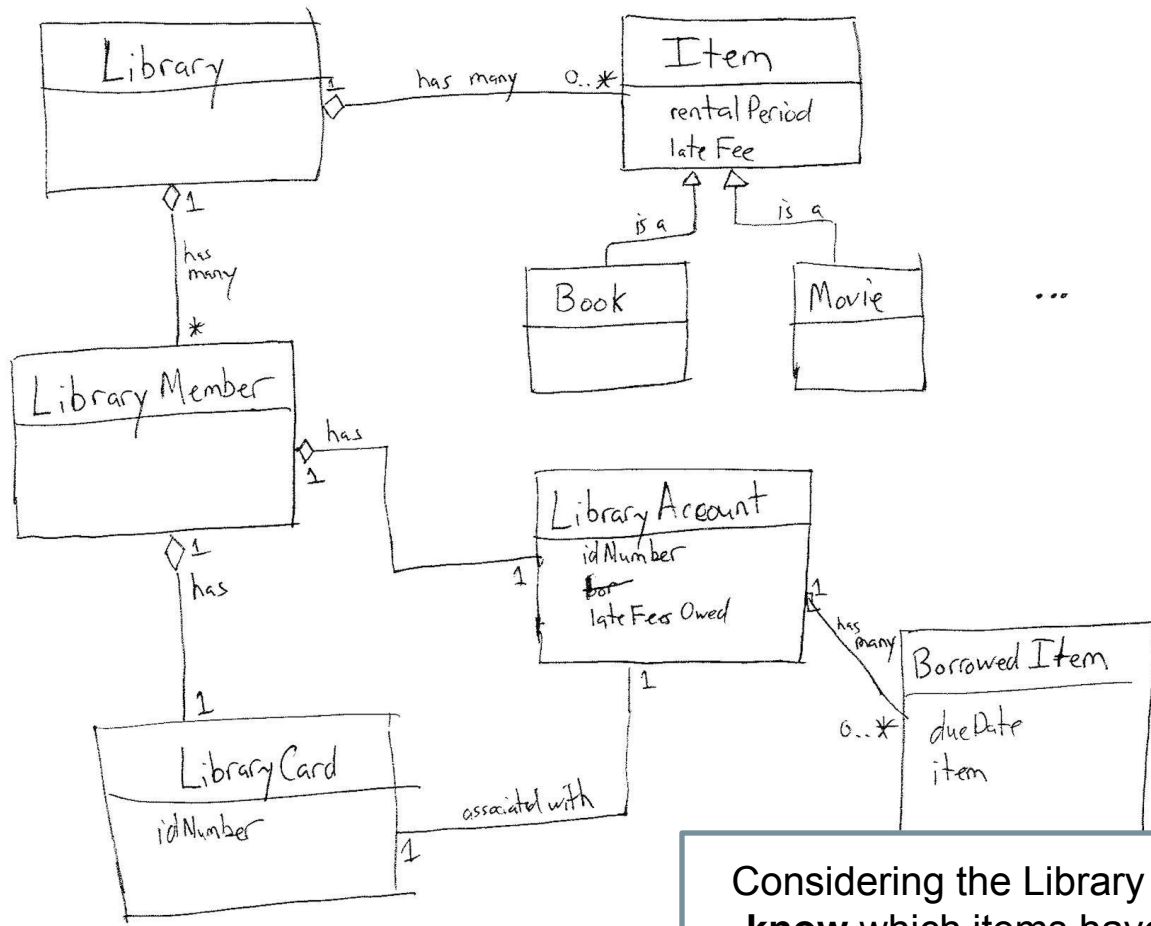

* old midterm question

Other Design Heuristics

In future lectures:

- Minimize mutability

- Minimize conceptual weight

- Favor composition/delegation over inheritance

- Use indirection to reduce coupling

- …

Object-level artifacts of this design process

- Object interaction diagrams add methods to objects
  - Can infer additional data responsibilities
  - Can infer additional data types and architectural patterns
- Object model aggregates important design decisions
  - Is an implementation guide

A UML sequence diagram showing the interaction between :Library System, :SessionManager, :Account, and :Book objects.

- borrow(book) → :Library System
- getCurrentSession() → :SessionManager
- account (return)
- lateFees := getLateFees() → :Account
- [lateFees == 0] loanPeriod := getLoanPeriod() → :Book

institute for
SOFTWARE
RESEARCH

Considering the Library problem, which class should **know** which items have been borrowed by a user? Which should **compute** late fees?

Design Goals, Principles, and Patterns

- Design Goals
  - Design for change, understanding, reuse, division of labor, …
- Design Principle
  - Low coupling, high cohesion
  - Low representational gap
- Design Heuristics
  - Law of demeter
  - Information expert
  - Creator
  - Controller

Take-Home Messages

Design is driven by quality attributes

- Evolvability, separate development, reuse, performance, …

Design principles provide guidance on achieving qualities

- Low coupling, high cohesion, high correspondence, …

GRASP design heuristics promote these principles

- Creator, Expert, Controller, …
